

FIRE AWARENESS KEY POINTS

The key points from session that happened at AkiraChix about fire safety measures

Breathing Problems

When a person is not breathing, we learned many ways you can help him/her.

1. First of all you need to check whether all of you you're in safety place
2. Check whether he/she is breathing or can talk
3. If he/she is not breathing, line out your fingers in middle of chest and start pump/ beat in the chest
4. You continue till the emergency come to save

Choking problems

When a person is having choking problems you do the following :

1. First make sure he/she is choking
2. Ask if you can help
3. Put your foot between his/her feet and go behind for stability and fold your arms around his or her waist , pull hard so that it can come out

FIRE MEASURE

First of all, there is different types of fire extinguishers to use during the time of fire. I just got two like are the main used in many places which is Foam and carbon dioxide.

1. Carbon Dioxide is the best to use in places that include things that might get damage like in kitchen you can use co2 to prevent spoil the food
2. Foam , this is considered as the dirty one because it contains powder , you can use it in places that doesn't have anything to be damaged as it best in turning off the fire
